## 11+ Maths Test 31

Question	Answer	Explanation	Marks
1	1.8 km	<p>To find the distance between Alice and Bob, we need to subtract the distance Bob has cycled from the distance Alice has cycled.</p> <p>Alice's distance: 12.6 km Bob's distance: 10.8 km</p> <p>Distance between Alice and Bob = Alice's distance - Bob's distance = 12.6 km - 10.8 km = 1.8 km</p> <p>Therefore, after 45 minutes, Alice and Bob are 1.8 km apart.</p>	1
2	east	<p>Sarah starts facing north. She then does three 180° turns anticlockwise:</p> <ul style="list-style-type: none"> <li>- After the first 180° turn anticlockwise, she is facing south.</li> <li>- After the second 180° turn anticlockwise, she is facing north again.</li> <li>- After the third 180° turn anticlockwise, she is facing south once more.</li> </ul> <p>Finally, she does one 90° turn clockwise from facing south, which results in her facing east.</p> <p>Therefore, Sarah is now facing east.</p>	1
3	Square-based pyramid	<p>A cube has 6 square faces.</p> <p>A triangular prism has 2 triangular faces and 3 rectangular faces, making a total of 5 faces.</p> <p>A square-based pyramid has 1 square face and 4 triangular faces, making a total of 5 faces.</p> <p>An octahedron has 8 triangular faces.</p> <p>Therefore, the square-based pyramid has the fewest number of faces with 5.</p>	1
4	30 cm, 40 cm	<p>The length and width pair must be 30cm and 40cm.</p> <p>This can be proven because we know the diagonal of 50cm must satisfy the Pythagorean theorem where <math>l^2 + w^2 = 2\,500</math> (from <math>50^2</math>). The only reasonable whole number factors that satisfy this equation are 30 and 40, as <math>30^2 + 40^2 = 900 + 1\,600 = 2\,500</math>, and the square root of <math>2\,500 = 50</math>cm, confirming our diagonal length.</p>	1
5	kilometres	<p>When measuring long distances, such as a charity bike ride, the most appropriate unit of measurement is kilometres.</p> <p>Kilometres are a larger unit than millimetres, centimetres, or metres, making them more suitable for expressing longer distances.</p> <p>For example, if Amelia cycles a total of 100,000 metres, it would be more practical to express this as 100 kilometres.</p> <p>Therefore, kilometres would be the most sensible choice for measuring the total distance of Amelia's long-distance bike ride.</p>	1

6	400	<p>We know that <math>3\,600 \div 18 = 200</math>. This means that if we divide 3 600 by 18, we get 200.</p> <p>Now, let's look at the question: <math>7\,200 \div 18</math>. We can see that 7 200 is exactly double 3 600.</p> <p>If we double the number being divided (3 600), we must also double the result of the division (200).</p> <p>Therefore, <math>7\,200 \div 18</math> must equal 400, which is double 200.</p>	1
7	£4.10	<p>To find out how much change Sarah will have, we need to:</p> <ol style="list-style-type: none"> <li>1. Calculate the total cost of the jelly beans by multiplying the price per bag by the number of bags: <math>\pounds 1.20 \times 7 = \pounds 8.40</math></li> <li>2. Subtract the total cost of the jelly beans from Sarah's budget: <math>\pounds 12.50 - \pounds 8.40 = \pounds 4.10</math></li> </ol> <p>Therefore, Sarah will have £4.10 change after buying the 7 bags of jelly beans.</p>	1
8	40	<p>To find the number of cookies that can be made, we need to divide the total amount of cookie dough by the amount used for each cookie.</p> <p>Total cookie dough: 3 600 g Dough used per cookie: 90 g</p> <p>Number of cookies = <math>3\,600 \text{ g} \div 90 \text{ g} = 40</math></p> <p>Therefore, the bakery can make a maximum of 40 cookies with the given batch of dough.</p>	1
9	13.5 dozen	<p>To find the total number of dozen cookies Sarah baked over the three days, we need to add the number of dozen cookies she baked each day:</p> <p>Monday: 3.25 dozen Tuesday: 5.5 dozen Wednesday: 4.75 dozen</p> <p><math>3.25 + 5.5 + 4.75 = 13.5</math></p> <p>Therefore, Sarah baked a total of 13.5 dozen cookies over the three days.</p>	1
10	4 units east and 4 units north	<p>The ship's initial coordinates are (7, -12), and its final coordinates are (11, -8). To determine the ship's movement, we need to calculate the change in each coordinate.</p> <p>Change in x-coordinate: <math>11 - 7 = 4</math> Change in y-coordinate: <math>-8 - (-12) = 4</math></p> <p>The ship moved 4 units in the positive x-direction (east) and 4 units in the positive y-direction (north).</p> <p>Therefore, the correct answer is "4 units east and 4 units north".</p>	1
